

Stage 1: Perceptual Decision

VLM views a visual stimulus and makes a binary forced-choice perceptual decision, analogous to a human **Type-1 judgment** based on sensory evidence.

Example Prompt:

"Which one has more: O or X?"

Choose one:

A. O

B. X

Answer with A or B only, without any reasoning."

Stage 2: Confidence Rating

Immediately after its perceptual answer, the VLM reports how confident it is in that choice, analogous to a human **Type-2 judgment** based on self-evaluation of certainty.

Example Prompt:

"Based on your previous answer, how confident are you in your choice? Rate your confidence from 1 to 5, where 1 means very uncertain and 5 means very certain. Answer with 'confidence: N' only, where N is your confidence level."
